

CS 330: Operating Systems

2026-27 Semester 1

Summary

In this course, we will learn about the design and implementation of operating systems.

Outcomes

- Understand functions of an OS.
- Understand and implement common scheduling algorithms, memory management techniques, file systems.
- Use threads and synchronization primitives to build concurrent programs and argue their correctness..

Evaluation

- Theory quizzes (best 5 out of 6) - 50%
- Midsem - 10%
- Endsem - 10%
- Coding projects - 30%

Theory quizzes will be during lecture hours. If you miss one for any reason, there will not be a compensatory exam. If you miss more than one due to medical or other emergencies, then your normalized average over the rest of the exams will be your score for the missed ones.

Tentative Outline

We will follow the textbook chapters as closely as reasonably possible.
